03 Major

04 Favorite series, film

Agenda

What we'll cover in this session

- Introduction
- Join our Community
- What is React?
- Why React?
- Rendering UI Components with React
- Live Demo

Program Prerequisites

you don't have to be a master

1 HTML/CSS

2 JavaScript

Dos

What students should do to graduate

- o Attend Weekly Sessions.
- o Make progress in your classroom each week.
- o Submit the first project before its deadline.

Don'ts

What to avoid

Plagiarism

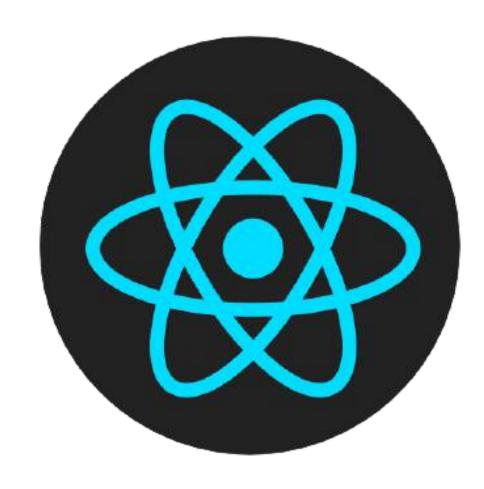

Note:

Incase I got disconnected at anytime for more than 5 mins we will consider it as a 10 mins break.

What is React?

- React is a JS library used for building reusable, complex UI components.
- React is Component-Based.
- Developed and maintained by Facebook and became open- sourced in 2013.
- Components can be nested inside each other to build the whole page.

Why choosing React?

Uses Virtual DOM

Uni-directional Data flow

Composition

Uses JSX

Most Famous Frontend Framework

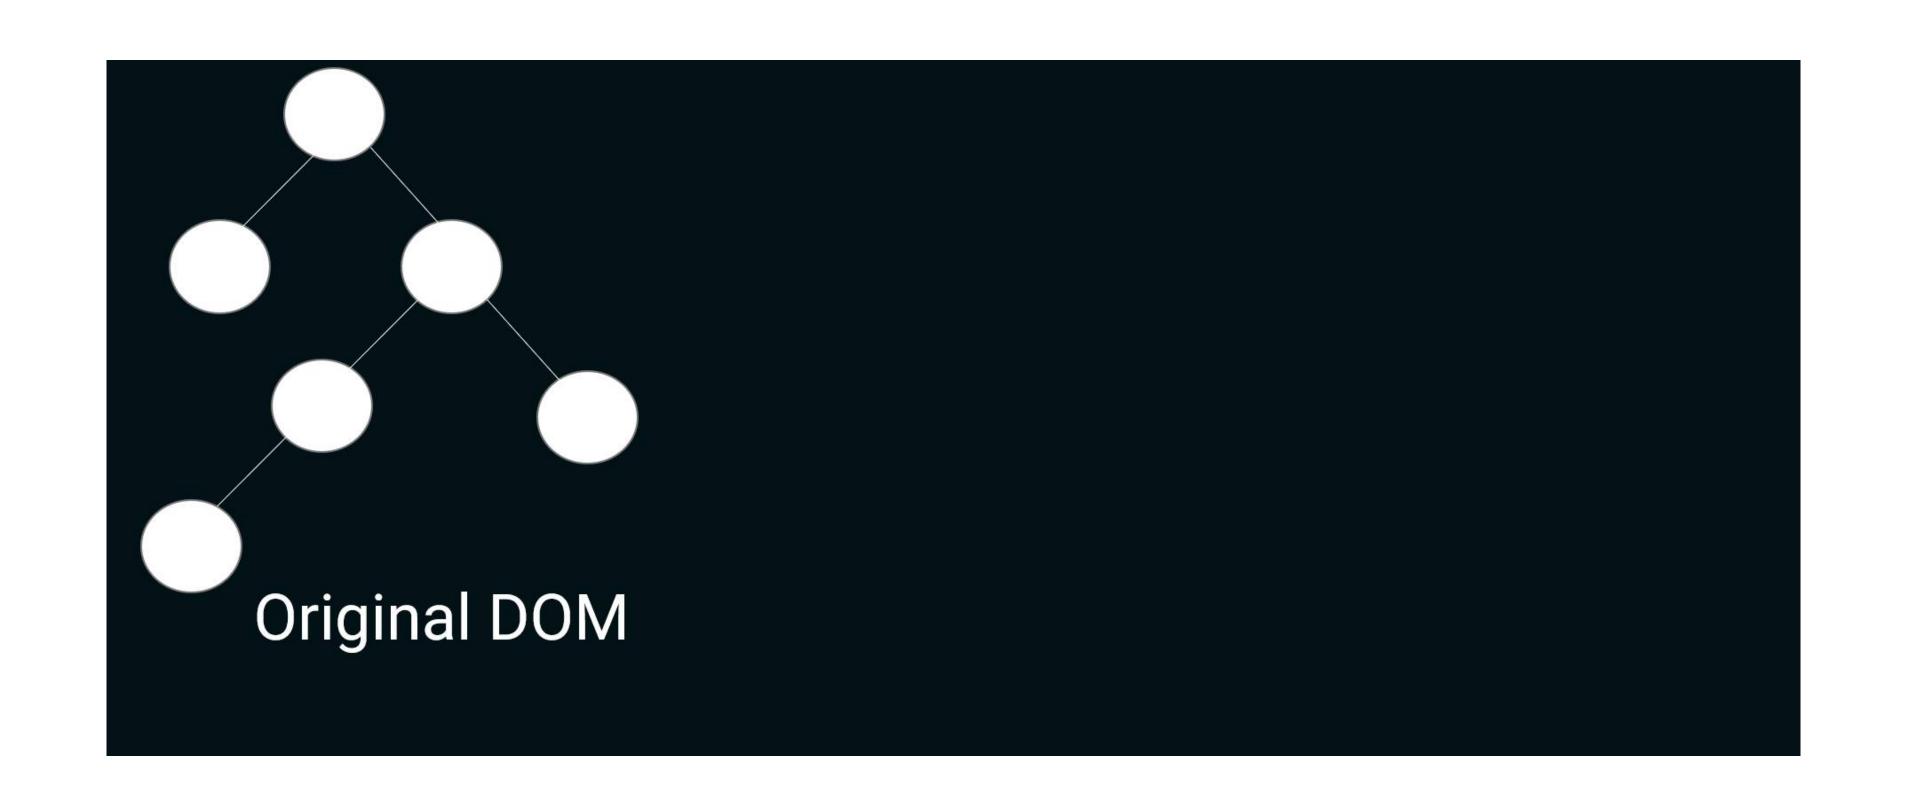

Real DOM

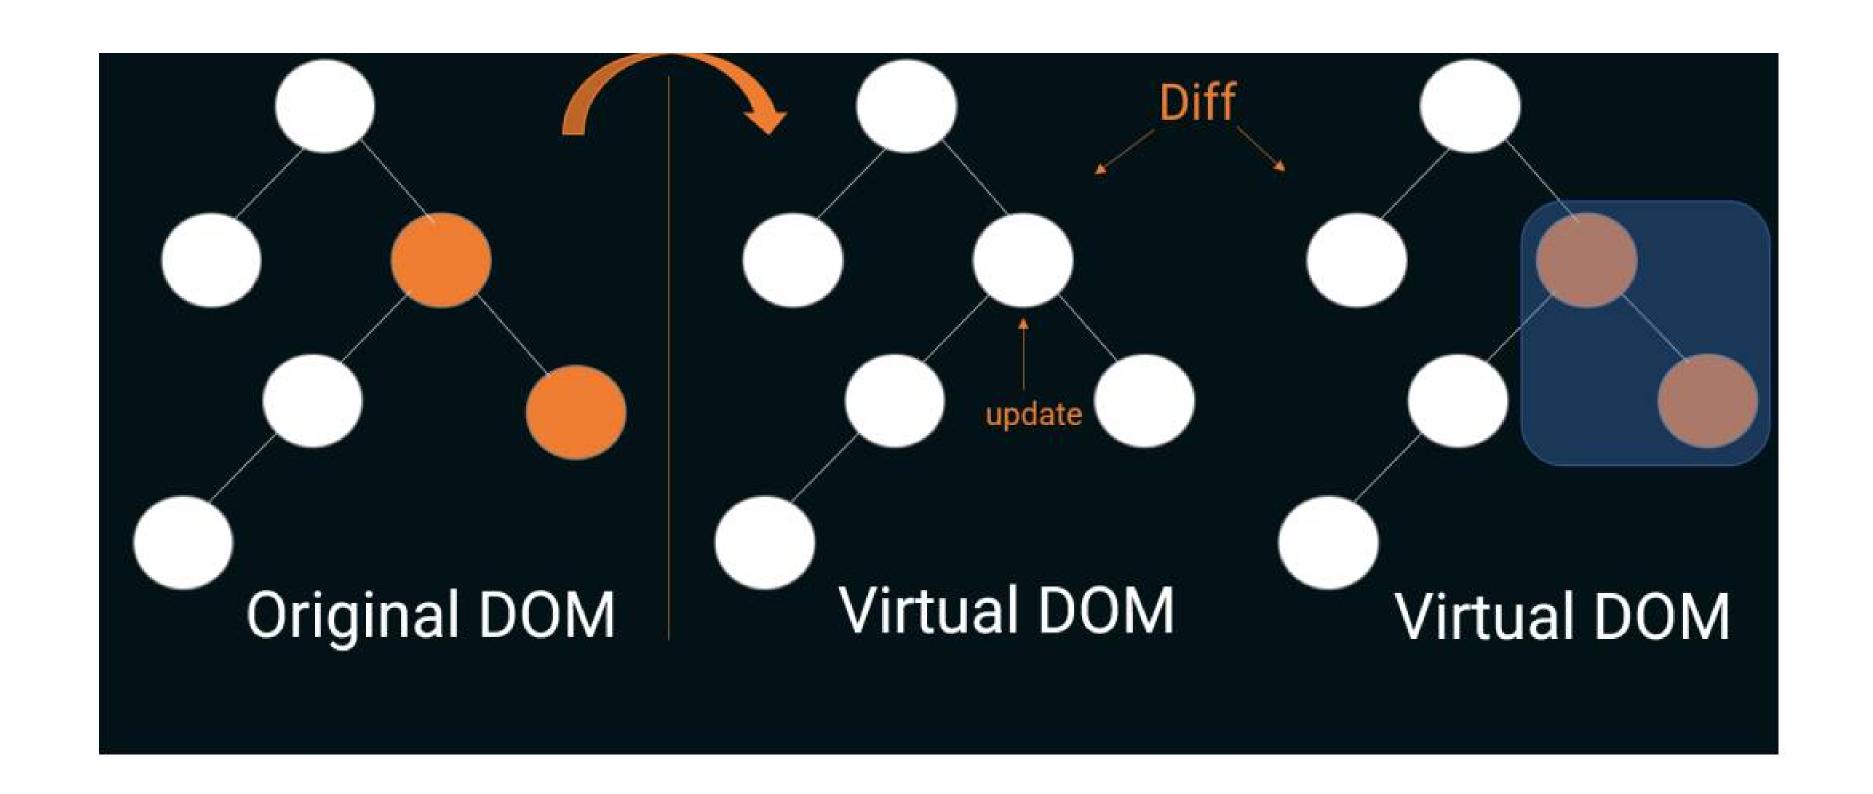

Virtual DOM

- **Data representation** of the objects that build the structure of the page.
- Can be used as a programming Interface to access DOM elements.
- On updates, *The changed objects and other objects gets updated.*
- DOM Manipulation is very expensive and memory intensive.

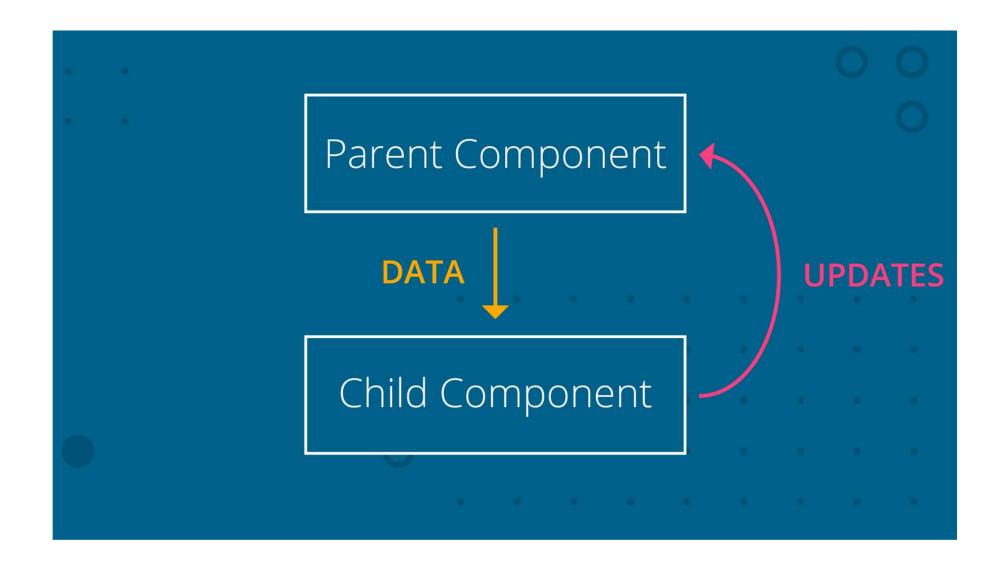

- Virtual representation of the actual DOM. (A copy) React build a copy of the real DOM and keeps it in memory.
- On updates, The changed objects, and the changed objects only, get updated on the real DOM.
- VDOM manipulation is Cheap, Fast and memory efficient.

Uni-Directional Data flow

- In React, data flows in **only one direction**, from parent to child.
- Parent is the one and only responsible for updating the data.
- For the child to update the props, The parent must pass a callback function

Composition

- Composition is a **pattern** that is used to combine simple functions or components to build more complicated ones
- In React, Composition means combining simple components to build complex ones.

```
<Layout>
     <Navbar />
          <MainContent />
          <Footer />
          </Layout>
```

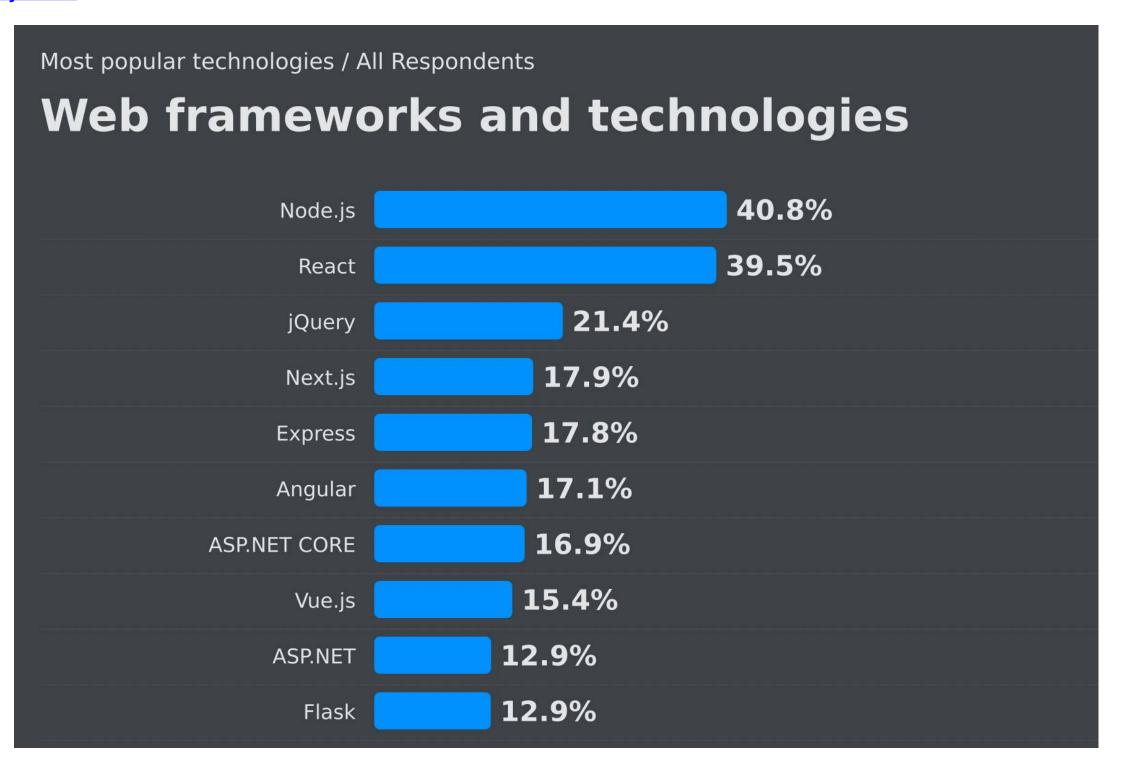

JSX (JavaScript HTML)

JSX is a combination of **JavaScript and HTML** that allows us to write HTML into javascript files.

```
class Hello extends React.Component {
 render() {
   return <h1>Hello, {this.props.toWhat}!</h1>;
ReactDOM.render(
 <Hello toWhat="world" />,
 document.getElementById("root")
class Hello extends React.Component {
  render() {
    return React.createElement("h1", null, `Hello, ${this.props.toWhat}!`);
ReactDOM.render(
 React.createElement(Hello, { toWhat: "world" }, null),
 document.getElementById("root")
```

Most Famous Frontend Framework

according to Stackoverflow Survey 2024

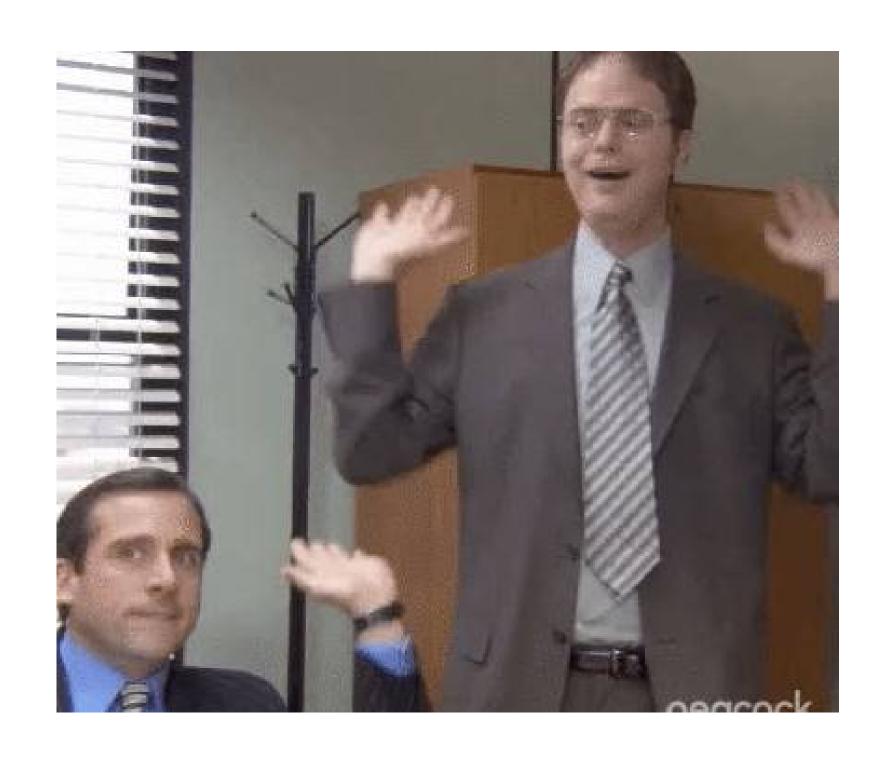

React Component *

The heart of every react application

Functional Component vs Class Components

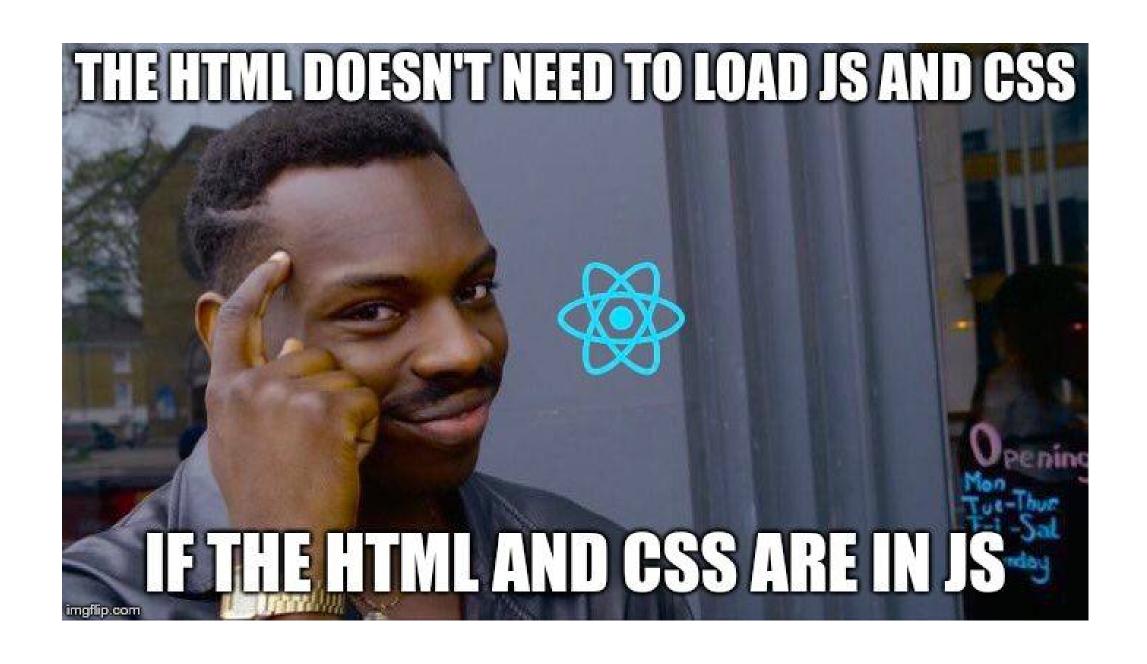

```
//uses functional component
    function App() {
      return <div className='App'>This is a functional component</div>;
   //uses class component
    class ClassApp extends React.Component {
      render() {
        return <div className='App'>This is a class component</div>;
11 }
```

Demo Time

Grab your coffee and let's get started.

Meme of the day

Any Questions?

A wise man once said,
"There is no dump questions"

Thank you!
